

Report on Solving Maliteboho's Online Presence Problem

Introduction

This report explains how a digital solution was developed to solve the problem of poor online presence for Maliteboho's restaurant business. The solution involved identifying business challenges, applying the Systems Development Life Cycle (SDLC), and creating a website that matched the owner's needs and preferences. Due to financial limitations, the website was hosted using GitHub Pages as a free hosting platform.

1. Identified a Real Problem

The first step was identifying the major problems affecting the business.

After observing the operations and discussing with the business owner, it was discovered that the business had limited online visibility. Customers mostly depended on physical visits, phone calls, or word of mouth to know about the restaurant services.

The following problems were identified:

- The business did not have a professional website.
- Customers could not easily view food services, prices, or contact information online.
- There was no proper digital platform to market the business.
- Potential customers outside the local area could not easily discover the business.
- Information sharing was slow and depended heavily on manual communication.
- The business lacked a modern digital identity compared to other growing businesses.

The owner also explained the type of website she wanted, including:

- an attractive design,
- affordable presentation,
- food service information,
- contact details,
- mobile-friendly appearance,
- and a simple professional layout.

This showed a real need for a digital solution.

2. Applied Systems Life Cycle and Relevant Skills

To solve the problem, the Systems Development Life Cycle (SDLC) was applied.

A. Analysis Phase

During this phase:

- The business operations were observed.
- Discussions were held with the owner to understand business goals and customer needs.
- The required website features were identified.
- The target audience and expected appearance were analyzed.

Important information collected included:

- pricing ideas,
 - food services offered,
 - preferred colors and layout,
 - customer communication needs,
 - and affordable hosting requirements.
-

B. Design Phase

A rough structure of the website was planned before development.

The website was designed to include:

- Home page
- About section
- Restaurant services
- Contact information
- Attractive navigation menu
- Mobile-responsive layout

Attention was given to:

- user friendliness,
- clean design,
- readability,
- and accessibility on phones and computers.

C. Development Phase

Relevant web development skills were applied to build the solution.

The technologies used included:

- HTML for website structure,
- CSS for styling and layout,
- and basic web design principles.

The website was developed according to the owner's preferred appearance and business goals.

The solution focused on:

- presenting the business professionally,
- improving online visibility,
- and making information easily accessible to customers.

D. Testing Phase

The website was tested to ensure:

- pages displayed correctly,
- navigation worked properly,
- content was readable,
- and the website functioned well on mobile devices.

Corrections and improvements were made where necessary.

E. Implementation Phase

Due to financial budget limitations, a free hosting solution was selected.

The website was deployed and hosted using:
GitHub

GitHub Pages was used because it:

- allowed free website hosting,

- supported static websites,
- provided easy updates,
- and reduced operational costs for the business.

This made it possible for the business to gain an online presence without immediate hosting expenses.

3. Problem Was Solved and Digital Solution Provided

The project successfully provided a digital solution to the identified problem.

The business now has:

- an online presence,
- improved accessibility,
- better business presentation,
- and a platform where customers can view services online.

The website helped:

- market the restaurant services digitally,
- improve customer awareness,
- increase professionalism,
- and support future business growth.

The solution also demonstrated the practical application of:

- problem-solving,
 - systems analysis,
 - web development,
 - communication skills,
 - and digital innovation.
-

Conclusion

The project successfully solved the problem of limited online presence for Maliteboho's business by applying the Systems Development Life Cycle and web development skills to create a functional website. Despite financial limitations, the use of GitHub hosting provided an

affordable and effective solution that improved the business's digital visibility and customer accessibility.
